

Amendments to the Claims: This listing of claims will replace all prior versions, and listings, of claims in the application

Listing of Claims:

1. (Cancelled)

2. (Original) A core for use in a motor, said motor including N and S magnetic poles for generating a magnetic field to which said core is opposed, said core comprising:

a plurality of slots formed in said core, said slots have an electrical angle which is one of:

- a) between 80 degrees and 95 degrees; and
- b) between 20 degrees and 35 degrees

wherein a first portion of said core is displaced from a second portion of said core by an angle equal to $1/4$ of a basic cogging torque cycle of said motor.

a number of said magnetic poles is $2m$ and a number of said slots is $6n$ (m and n are integers)

3. (Original) The core as described in claim 2 wherein

a ratio of said number of magnetic poles to said number of slots is $4:3$,

said core is configured so that opening angles of salient pole tips of said core are constant at electrical angle γ ranging from 145° to 160° ($(\gamma/m)^\circ$ in mechanical angle), and

said core is configured so that the salient pole tips on a half side of said core are displaced clockwise by an angle equal to one-eighth the cycle of the basic cogging torque ($(45/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $6n$), and the salient pole tips on the other half side are displaced counterclockwise by the same angle.

4. (Original) The core as described in claim 2 wherein

a ratio of said number of magnetic poles to said number of slots is 4:3,

said core is configured so that opening angles of salient pole tips of said core are constant at an electrical angle δ ranging from 205° to 220° ($(\delta/m)^\circ$ in mechanical angle), and

said core is configured so that the salient pole tips on a half side of said core are displaced clockwise by an angle equal to one-eighth the cycle of the basic cogging torque $((45/k)^\circ$ in mechanical angle, where k is the least common multiple of 2m and 6n), and the salient pole tips on the other half side are displaced counterclockwise by the same angle.

5. (Original) The core as described in claim 2 wherein

said core is configured so that opening angles of slots of said core are constant at an electrical angle α ranging from 80° to 95° ($(\alpha/m)^\circ$ in mechanical angle), and

said core is configured so that the slots on a half side of said core are displaced clockwise by an angle equal to one-eighth the cycle of the basic cogging torque $((45/k)^\circ$ in mechanical angle, where k is the least common multiple of 2m and 6n), and the slots on the other half side are displaced counterclockwise by the same angle.

6. (Original) The core as described in claim 2 wherein

said core is configured so that opening angles of slots of said core are constant at an electrical angle β ranging from 20° to 35° ($(\beta/m)^\circ$ in mechanical angle), and

said core is configured so that the slots on a half side of said core are displaced clockwise by an angle equal to one-eighth the cycle of the basic cogging torque $((45/k)^\circ$ in mechanical angle, where k is the least common multiple of 2m and 6n), and the slots on the other half side are displaced counterclockwise by the same angle.

7. (Original) The core as described in claim 2 wherein

said core is configured so that slots of said core are disposed with an equal angular pitch, and slots each having an opening angle equal to an electrical angle α (80° to 95°) – one-quarter the cycle of the basic cogging torque ($(\alpha/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of 2m and 6n) and slots each having an opening angle equal to the electrical angle α (80° to 95°) + one-quarter the cycle of the basic cogging torque ($(\alpha/m+90/k)^\circ$ in mechanical angle) are alternately provided.

8. (Original) The core as described in claim 2 wherein

said core is configured so that slots of said core are disposed with an equal angular pitch, and slots each having an opening angle equal to an electrical angle β (20° to 35°) – one-quarter the cycle of the basic cogging torque ($(\beta/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of 2m and 6n) and slots each having an opening angle equal to the electrical angle β (20° to 35°) + one-quarter the cycle of the basic cogging torque ($(\beta/m+90/k)^\circ$ in mechanical angle) are alternately provided.

9. (Original) The core as described in claim 2 wherein

a ratio of said number of magnetic poles to said number of slots is 4:3, and

said core is configured so that salient pole tips of said core are disposed with an equal angular pitch, and salient poles each having an opening angle equal to an electrical angle γ (145° to 160°) – one-quarter the cycle of the basic cogging torque ($(\gamma/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of 2m and 6n) and salient poles each having an opening angle equal to the electrical angle γ (145° to 160°) + one-quarter the cycle of the basic cogging torque ($(\gamma/m+90/k)^\circ$ in mechanical angle) are alternately provided.

10. (Original) The core as described in claim 2 wherein

a ratio of said number of magnetic poles to said number of slots is 4:3, and

said core is configured so that salient pole tips of said core are disposed with an equal angular pitch, and salient poles each having an opening angle equal to an electrical angle δ

(205° to 220°) – one-quarter the cycle of the basic cogging torque ($(\delta/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $6n$) and salient poles each having an opening angle equal to the electrical angle δ (205° to 220°) + one-quarter the cycle of the basic cogging torque ($(\delta/m+90/k)^\circ$ in mechanical angle) are alternately provided.

11. (Original) The core as described in claim 2 wherein

a ratio said number of magnetic poles to said number of slots is 4:3, and

said core is configured so that salient pole tips of said core are disposed with an equal angular pitch, and salient poles on a half side of said core have an opening angle equal to an electrical angle γ (145° to 160°) – one-quarter the cycle of the basic cogging torque ($(\gamma/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $6n$) and salient poles on the other half have an opening angle equal to the electrical angle γ (145° to 160°) + one-quarter the cycle of the basic cogging torque ($(\gamma/m+90/k)^\circ$ in mechanical angle).

12. (Original) The core as described in claim 2 wherein

a ratio of said number of magnetic poles to said number of slots is 4:3, and

said core is configured so that salient pole tips of said core are disposed with an equal angular pitch, and salient poles on a half side of said core have an opening angle equal to an electrical angle δ (205° to 220°) – one-quarter the cycle of the basic cogging torque ($(\delta/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $6n$) and salient poles on the other half have an opening angle equal to the electrical angle δ (205° to 220°) + one-quarter the cycle of the basic cogging torque ($(\delta/m+90/k)^\circ$ in mechanical angle).

13. (Original) The core as described in claim 2 wherein

said core is configured so that slots of said core are disposed with an equal angular pitch, and slots on a half side of said core have an opening angle equal to an electrical angle α (80° to 95°) – one-quarter the cycle of the basic cogging torque ($(\alpha/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $6n$) and slots on the other half have an

opening angle equal to the electrical angle α (80° to 95°) + one-quarter the cycle of the basic cogging torque $((\alpha/m+90/k)^\circ$ in mechanical angle).

14. (Original) The core as described in claim 2 wherein

said core is configured so that slots of said core are disposed with an equal angular pitch, and slots on a half side of said core have an opening angle equal to an electrical angle β (20° to 35°) – one-quarter the cycle of the basic cogging torque $((\beta/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $6n$) and slots on the other half have an opening angle equal to the electrical angle β (20° to 35°) + one-quarter the cycle of the basic cogging torque $((\beta/m+90/k)^\circ$ in mechanical angle).

15-16. (Cancelled)

17. (Original) A core for use in a motor, said motor including N and S magnetic poles for generating a magnetic field to which said core is opposed, said core comprising:

a plurality of slots formed in said core, said slots have an electrical angle which is one of:

- a) between 80° and 95° ; and
- b) between 20° and 35°

a number of said magnetic poles is $2m$ and a number of said slot is $3n$ (m and n are integers)

wherein said core is configured by making coplanar and axial combinations of two core shapes each having the slots displaced by an angle equal to one-quarter the cycle of basic cogging torque $((90/k)^\circ$ in mechanical angle, where k is a least common multiple of $2m$ and $3n$).

18. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction, and is configured so that the opening angles of slots are constant at an electrical angle α ranging from 80° to 95° ($(\alpha/m)^\circ$ in mechanical angle), and salient pole tips in an upper half are displaced clockwise by an angle equal to one-eighth the cycle of the basic cogging torque ($(45/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and salient pole tips in a lower half are displaced counterclockwise by the same angle.

19. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction, and is configured so that the opening angles of slots of said core are constant at an electrical angle β ranging from 20° to 35° ($(\beta/m)^\circ$ in mechanical angle), and salient pole tips in a upper half are displaced clockwise by an angle equal to one-eighth the cycle of the basic cogging torque ($(45/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and salient pole tips in a lower half are displaced counterclockwise by the same angle.

20. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that slots of said half are disposed with an equal angular pitch, and slots each having an opening angle equal to an electrical angle α (80° to 95°) – one-quarter the cycle of the basic cogging torque ($(\alpha/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and slots each having an opening angle equal to the electrical angle α (85° to 95°) + one-quarter the cycle of the basic cogging torque ($(\alpha/m+90/k)^\circ$ in mechanical angle) are alternately provided, and

a lower half of said core is configured as a laterally inverted upper half.

21. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that slots of said half are disposed with an equal angular pitch, and slots each having an opening angle equal to an electrical angle β (20° to 35°) – one-quarter the cycle of the basic cogging torque ($(\beta/m - 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and slots each having an opening angle equal to the electrical angle β (25° to 35°) + one-quarter the cycle of the basic cogging torque ($(\beta/m + 90/k)^\circ$ in mechanical angle) are alternately provided, and

a lower half of said core is configured as a laterally inverted the upper half.

22. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that opening angles of slots of said half are constant at an electrical angle α ranging from 80° to 95° ($(\alpha/m)^\circ$ in mechanical angle), and slots disposed with an angular pitch equal to a quotient of 360° divided by the number of the slots + one-quarter the cycle of the basic cogging torque ($(120/m + 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and slots disposed with an angular pitch equal to the quotient of 360° divided by the number of the slots - one-quarter the cycle of the basic cogging torque ($(120/m - 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) are alternately provided, and

the lower half of said core is configured as a vertically inverted upper half.

23. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that opening angles of slots of said half are constant at an electrical angle β ranging from 20° to 35° ($(\beta/m)^\circ$ in mechanical angle), and slots disposed with an angular pitch equal to a quotient of 360° divided by the number of the slots + one-quarter the cycle of the basic cogging torque ($(120/m + 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and slots disposed with an angular

pitch equal to the quotient of 360° divided by the number of the slots - one-quarter the cycle of the basic cogging torque $((120/m - 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) are alternately provided, and

a lower half of said core is configured as a vertically inverted upper half.

24. (Original) The core as described in claim 17 wherein

a ratio of said number of magnetic poles to said number of slots is 4:3,

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that salient pole tips of said core are disposed with an equal angular pitch, and salient poles on a half side of said upper core half have an opening angle equal to an electrical angle γ (145° to 160°) - one-quarter the cycle of the basic cogging torque $((\gamma/m - 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and salient poles on the other half side have an opening angle equal to the electrical angle γ (145° to 160°) + one-quarter the cycle of the basic cogging torque $((\gamma/m + 90/k)^\circ$ in mechanical angle) and,

a lower half of said core is configured as a laterally inverted upper half.

25. (Original) The core as described in claim 17 wherein

a ratio of said number of magnetic poles to said number of slots is 4:3,

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that salient pole tips of said core are disposed with an equal angular pitch, and salient poles on a half side of said upper core half have an opening angle equal to an electrical angle δ (205° to 220°) - one-quarter the cycle of the basic cogging torque $((\delta/m - 90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and salient poles on the other half side have an opening angle equal to the electrical

angle δ (205° to 220°) + one-quarter the cycle of the basic cogging torque ($(\delta/m+90/k)^\circ$ in mechanical angle) and,

a lower half of said core is configured as a laterally inverted upper half.

26. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that slots of said core are disposed with an equal angular pitch, and slots on a half side of the upper core half have an opening angle equal to an electrical angle α (80° to 95°) – one-quarter the cycle of the basic cogging torque ($(\alpha/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and slots on the other half side have an opening angle equal to the electrical angle α (80° to 95°) + one-quarter the cycle of the basic cogging torque ($(\alpha/m+90/k)^\circ$ in mechanical angle), and

a lower half of said core is configured as a laterally inverted upper half.

27. (Original) The core as described in claim 17 wherein

said core has two different plane configurations in an axial direction,

an upper half of said core is configured so that slots of said core are disposed with an equal angular pitch, and slots on a half side of the upper core half have an opening angle equal to an electrical angle β (20° to 35°) – one-quarter the cycle of the basic cogging torque ($(\beta/m-90/k)^\circ$ in mechanical angle, where k is the least common multiple of $2m$ and $3n$) and slots on the other half side have an opening angle equal to the electrical angle β (20° to 35°) + one-quarter the cycle of the basic cogging torque ($(\beta/m+90/k)^\circ$ in mechanical angle), and

a lower half of said core is configured as a laterally inverted upper half.

28-30 (Cancelled)

31. (Original) The core as described in claim 17 wherein

said core is structured by combining a plurality of separated cores whose inner walls of a plurality of salient poles are joined by an annular part.

32. (Cancelled)

33. (Original) The core as described in claim 31 wherein

said separated cores are shaped identical.

34-35. (Cancelled)

36. (Original) The core as described in claim 2 wherein

said core is structured by laminating thin plates of magnetic material.

37-38. (Cancelled)

39. (Original) The core as described in claim 17 wherein

said core is structured by laminating thin plates of magnetic material.

40-42. (Cancelled)

43. (Original) A motor including:

(a) magnetic field generating means having N and S magnetic poles for generating a magnetic field; and

(b) a core made of magnetic material and opposed to said magnetic field generating means;

wherein one of said magnetic field generating means and said core rotates with respect to the other,

wherein a number of said magnetic poles is $2m$ and a number of slots of said core is $6n$ (m and n are integers),

a plurality of slots formed in said core, said slots have an electrical angle which is one of:

a) between 80 degrees and 95 degrees; and

b) between 20 degrees and 35 degrees

wherein said core is configured by combining two core shapes each having the slots displaced by an angle equal to one-quarter the cycle of basic cogging torque $((90/k)^\circ$ in mechanical angle, where k is a least common multiple of $2m$ and $6n$).

44-45. (Cancelled)

46. (Original) A motor including:

(a) magnetic field generating means having N and S magnetic poles for generating a magnetic field; and

(b) a core made of magnetic material and opposed to said magnetic field generating means;

wherein one of said magnetic field generating means and said core rotates with respect to the other,

wherein a number of said magnetic poles is $2m$ and a number of slots of said core is $3n$ (m and n are integers),

a plurality of slots formed in said core, said slots have an electrical angle which is one of:

- a) between 80 degrees and 95 degrees; and
- b) between 20 degrees and 35 degrees

wherein said core is configured by making coplanar and axial combinations of two core shapes each having the slots displaced by an angle equal to one-quarter the cycle of basic cogging torque $((90/k)^\circ$ in mechanical angle, where k is a least common multiple of $2m$ and $3n$).

47-50. (Cancelled)

51. (Original) The motor described in claim 46 wherein

polarization is performed at a skew angle of $(200/k)^\circ$ or less in central angle (k is the least common multiple of $2m$ and $3n$).

52-55. (Cancelled)

56. (Original) The motor described in claim 51 wherein

polarization is performed at a skew angle ranging from $(80/k)^\circ$ to $(100/k)^\circ$ in said central angle.

57-58. (Cancelled)

Respectfully submitted,

Lawrence E. Ashery, Reg. No. 34,515
